Regular Expressions

Regular Expressions

Regular expressions describe regular languages

recognizes - tan. mlar mi accept7

Example:

$$(a+b\cdot c)^*$$

abelea alele

describes the language

$$\{a,bc\}^* = \{\varepsilon,a,bc,aa,abc,bca,...\}$$

Recursive Definition

Primitive regular expressions:

$$\vec{\mathcal{O}}, \ \vec{\mathcal{E}}, \ \alpha$$

Given regular expressions r_1 and r_2

$$r_1 + r_2$$
 $r_1 \cdot r_2$
 r_1
 r_1
 r_1

Are regular expressions

$$(a+b\cdot c)^*\cdot (c+\varnothing)$$

Not a regular expression: (a+b+)

$$(a+b+)$$

Languages of Regular Expressions

$$L(r)$$
: language of regular expression r

$$L((a+b\cdot c)^*) = \{\varepsilon, a, bc, aa, abc, bca, \ldots\}$$

Definition

For primitive regular expressions:

$$L(\varnothing) = \varnothing$$

$$L(\varepsilon) = \{\varepsilon\}$$

$$L(a) = \{a\}$$

Definition (continued)

For regular expressions r_1 and r_2

$$L(r_1 + r_2) = L(r_1) \cup L(r_2)$$

$$L(r_1 \cdot r_2) = L(r_1) L(r_2)$$

$$L(r_1^*) = (L(r_1))^*$$

$$L((r_1)) = L(r_1)$$

6

Regular expression: $(a+b) \cdot a^*$

$$L((a+b) \cdot a^*) = L((a+b)) L(a^*)$$

$$= L(a+b) L(a^*)$$

$$= (L(a) \cup L(b)) (L(a))^*$$

$$= (\{a\} \cup \{b\}) (\{a\})^*$$

$$= \{a,b\} \{\varepsilon,a,aa,aaa,...\}$$

$$= \{a,aa,aaa,...,b,ba,baa,...\}$$

Regular expression

$$r = (a+b)^* (a+bb)$$

alasans aban SL

$$L(r) = \{a,bb,aa,abb,ba,bbb,...\}$$

Regular expression
$$r = (aa)^*(bb)^*b$$

$$L(r) = \{a^{2n}b^{2m}b: n, m \ge 0\}$$

Regular expression
$$r = (0+1)^* 00 (0+1)^*$$

$$L(r) = \{ all strings containing substring 00 \}$$

Regular expression
$$r = (1+01)^*(0+\varepsilon)$$

$$L(r) = \{ all strings without substring 00 \}$$

Equivalent Regular Expressions

Definition:

Regular expressions r_1 and r_2

are equivalent if
$$L(r_1) = L(r_2)$$

 $L = \{ all strings without substring 00 \}$

$$r_{1} = (1+01)^{*}(0+\varepsilon)$$

$$r_{2} = (1^{*}01(1^{*}))^{*}(0+\varepsilon) + 1^{*}(0+\varepsilon)$$

$$L(r_1) = L(r_2) = L$$

 r_1 and r_2 are equivalent regular expressions

Regular Expressions and Regular Languages

Theorem

Languages

Regular Expressions

Regul

Proof - Part 1

Languages
Generated by
Regular Expressions
Regular Expressions

For any regular expression r the language L(r) is regular

Proof by induction on the size of r

Induction Basis

Primitive Regular Expressions:

 $\mathcal{E},$

 α

Corresponding

NFAs

$$L(M_1) = \emptyset = L(\emptyset)$$

$$L(M_2) = {\varepsilon} = L(\varepsilon)$$

regular languages

$$L(M_3) = \{a\} = L(a)$$

Inductive Hypothesis

Suppose that for regular expressions r_1 and r_2 , $L(r_1)$ and $L(r_2)$ are regular languages

Inductive Step

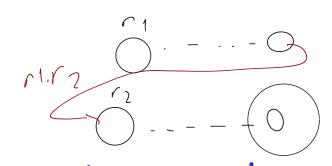

We will prove:

$$L(r_1+r_2)$$

$$L(r_1 \cdot r_2)$$

$$L(r_1^*)$$

$$L((r_1))$$

Are regular

Languages

By definition of regular expressions:

$$L(r_1 + r_2) = L(r_1) \cup L(r_2)$$

$$L(r_1 \cdot r_2) = L(r_1) L(r_2)$$

$$L(r_1^*) = (L(r_1))^*$$

$$L((r_1)) = L(r_1)$$

By inductive hypothesis we know:

$$L(r_1)$$
 and $L(r_2)$ are regular languages

We also know:

Regular languages are closed under:

Union $L(r_1) \cup L(r_2)$ Concatenation $L(r_1) L(r_2)$ Star $(L(r_1))^*$

Therefore:

$$L(r_1 + r_2) = L(r_1) \cup L(r_2)$$

$$L(r_1 \cdot r_2) = L(r_1) L(r_2)$$

$$L(r_1^*) = (L(r_1))^*$$

Are regular languages

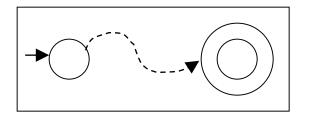

$$L((r_1)) = L(r_1)$$
 is trivially a regular language (by induction hypothesis)

End of Proof-Part 1

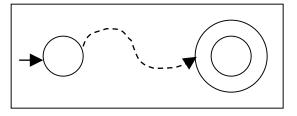

Using the regular closure of operations, we can construct recursively the NFA M that accepts L(M) = L(r)

Example: $r = r_1 + r_2$

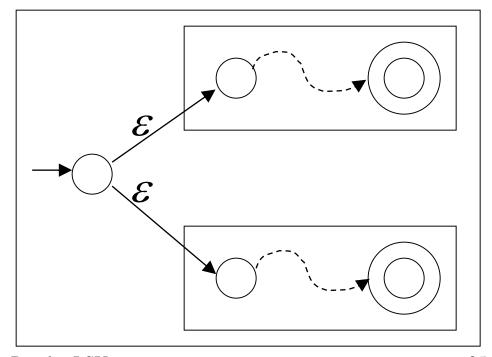

$$L(M_1) = L(r_1)$$

$$L(M_2) = L(r_2)$$

Proof - Part 2

For any regular language L there is a regular expression r with L(r) = L

We will convert an NFA that accepts L to a regular expression

Busch - LSU

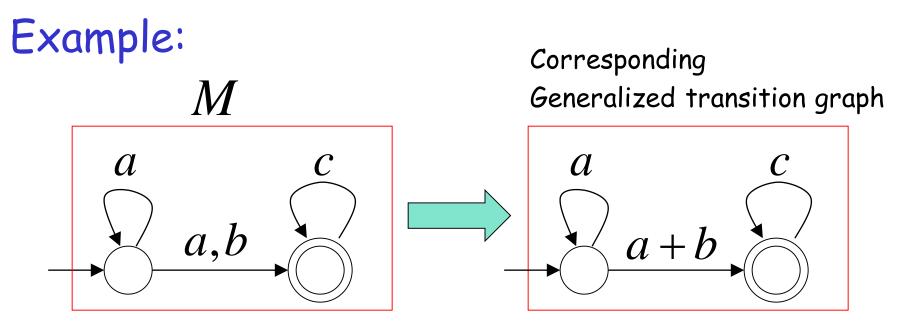

Since L is regular, there is a NFA M that accepts it

$$L(M) = L$$

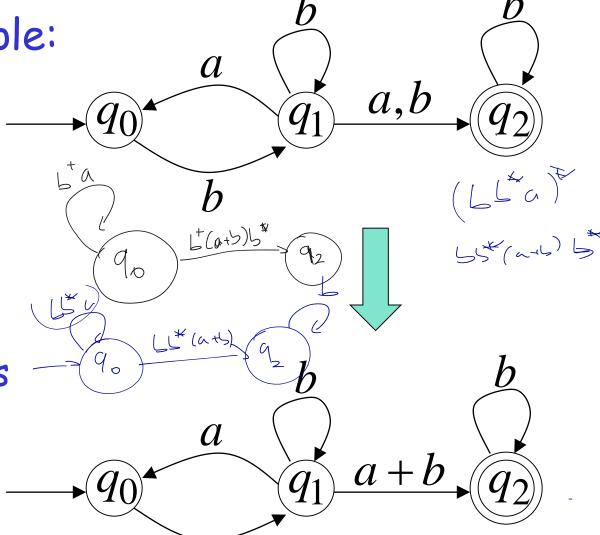

Take it with a single accept state

From M construct the equivalent Generalized Transition Graph

in which transition labels are regular expressions

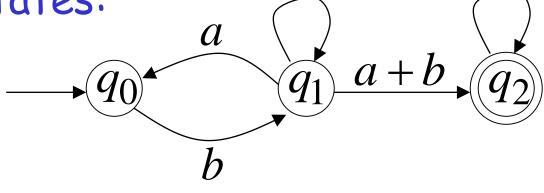

Another Example:

Transition labels are regular expressions

Reducing the states:

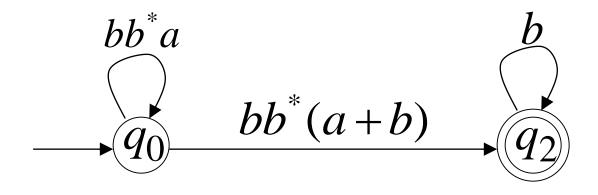

(LL* a) * LL*(a+5) 5*

Transition labels are regular expressions

$$bb^*a$$

$$bb^*(a+b)$$

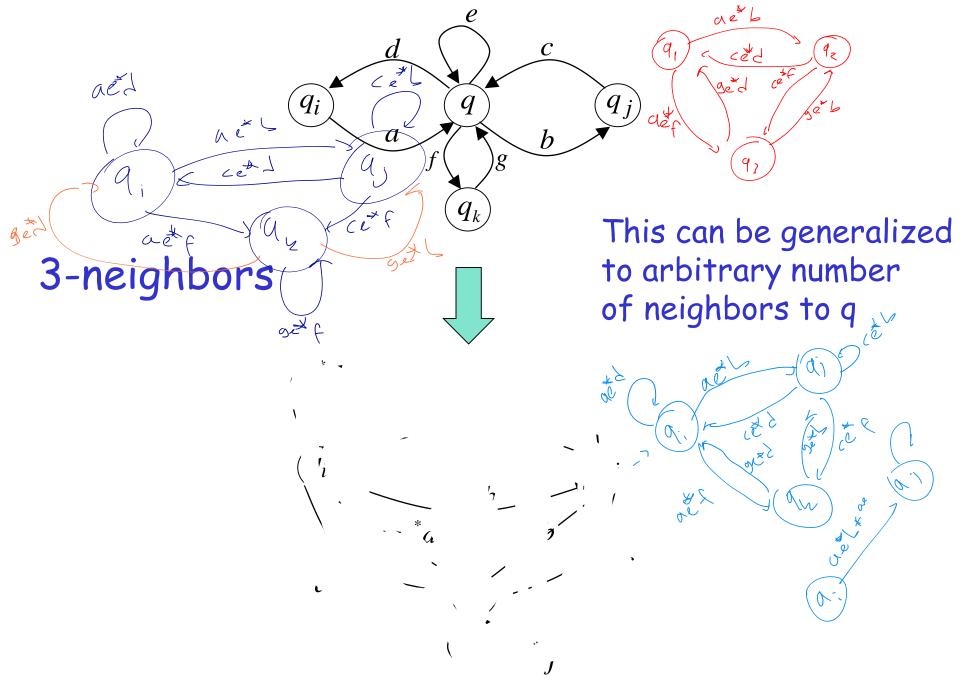

Resulting Regular Expression:

$$r = (bb^*a)^*bb^*(a+b)b^*$$

$$L(r) = L(M) = L$$

In General atb 90 Removing a state: q_{j} q_i qa2-neighbors ae^*d ce^*b ce^*d q_i q_{j} ae^*b Costas Busch - LSU

By repeating the process until two states are left, the resulting graph is

Resulting graph Initial graph 11/2. ((u+1301/2)

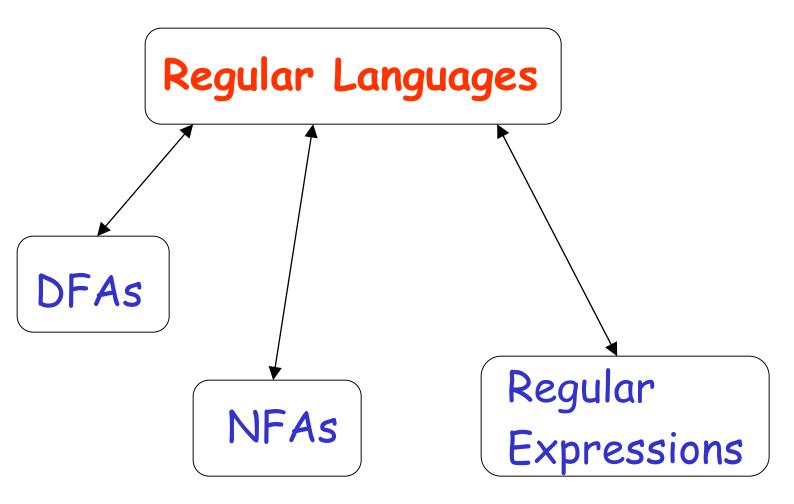

The resulting regular expression:

$$r = r_1^* r_2 (r_4 + r_3 r_1^* r_2)^*$$

$$L(r) = L(M) = L$$

End of Proof-Part 2

Standard Representations of Regular Languages

When we say: We are given a Regular Language L

We mean: Language L is in a standard representation

(DFA, NFA, or Regular Expression)
